ABSTRACT:

In our project, "**Hotel Management System**" we have tried to show how the data/information in hotels are managed. This is just an overview of management in hotels. We had achieved this by various modules. The customer is provided different services like they can **view the hotel gallery** on **booking** a room meaning they can get the rooms information because the hotel comprises different types of rooms and depending on the rooms luxury the room bill varies and can also **cancel a booking** already made. After booking a room the **customer** is asked to enter their information like name, ID card number, mobile number, check-in date and check out date to keep track of their customers and if the customer had inputted wrong information mistakenly they can also **edit their information**. Our code has also the ability **to search for a particular customer** through their ID number and room number and view their information. Similarly all **customers info** could also be **displayed** by called function. And **bill for customer** would be **generated** when they check out from the hotel. And the customer can also input any complaints so the management would work on it to better the hotel.

The purpose of this program is to have the idea or to study about how the management is done in hotels. By adding many more modules this type of project can have scope in various hotels.

List of functionalities:

In this project we are storing all the information related to customer and call following functions for functionality of hotel management project:

1-room_booking shows list of room classes on screen and allow customer to select room according to their choice.

2-save_customer allow customer to take information from customer and make copy of information in text file.

3-search_Customerallow user to check for the particular customer by entering room number display their information on screen

4-modify_info allow the customer to add and modify their information if customer has inputted wrong information.

5-Display_info allow the user to enter password and then display all the stored information related to customer or room e.t.c on screen

6-Cancel_booking allow the customer to cancel the booking of room

7-bill_generation allow allow user to genereate bill according to class of room and number of days thy spend

8-Complains allow the customer to write down complain regarding staff or hotel.

Topics of programming language used in project:

1. User defined Functions.
2. Classes.
3. Structures.
4. Conditional statements.
5. Switches.
6. Pre-defined functions.

Work distribution of each group member:

- **Bushra Naseer:** Code designing , Flow chart , room_booking Function , Save_customer function.
- **Aemen Batool:** Code modification, search _customer function , modify_info function.
- **Badar ul Islam:** Display_info function , Cancel_booking function , Bill_generation allow function , Complains .
